**MVS Solutions Inc. announces Availability of ThruPut Manager® AE with PCS at CA World 2010.**

CA WORLD, LAS VEGAS, NV, May 17, 2010. - MVS Solutions Inc. is pleased to announce the availability of **ThruPut Manager® AE with PCS** (Automation Edition with Production Control Services), or **TM AE PCS**. **TM AE PCS** modernizes and simplifies batch service delivery in a z/OS JES2 environment and represents a quantum leap in z/OS production batch management, meeting the long-standing needs of Production Control. In particular, it extends the scheduling goals of CA 7® Workload Automation to the z/OS execution arena.

This is the most significant advance in batch processing in many years. Unlike standard z/OS, **ThruPut Manager AE with PCS** takes into account the dependencies specified in the CA 7 scheduling database, the critical paths that may change over a production run and the importance of each application compared to any other work running. With **TM AE PCS**, z/OS production execution is managed according to the CA 7 schedule and due-out times.

"CA Technologies' customers are looking for ways to do more with less, increasing efficiencies while more effectively managing workloads within their CA 7 scheduling criteria," said Mark Combs, distinguished senior vice president in CA Technologies' Mainframe business unit. "MVS Solutions' **ThruPut Manager AE with PCS** solution understands the chain of dependencies within the batch stream, and the critical path providing a robust ability in achieving their objectives."

**With ThruPut Manager AE with PCS:**

- *The schedule completes in the best time possible.* The critical path is dynamically managed and the most important jobs are favored based on due-out time. Jobs complete sooner as execution delays are minimized and interference from lower priority or non-production work is eliminated. And automatic escalation ensures the important work is completed first in tight situations.
- *Resource Utilization is Optimized.* z/OS resources are utilized to best meet the objectives of the CA 7 schedule. By running at optimal efficiency, batch workload is actually finished sooner. Batch window constraints are eased and there is the potential to defer CPU upgrades.
- *Production Control staff are freed for more useful tasks.* Integrated monitoring screens and enhanced alerts keep Production Control staff informed as the schedule progresses. Micro-managing the workload on a job-by-job basis is no longer necessary. And the CA 7 database maintenance effort is significantly reduced.

"With **ThruPut Manager AE with PCS**, z/OS understands that a production job is not an island to itself. It understands the production schedule, the chain of dependencies within the batch stream, and the critical path. Accordingly, z/OS can manage its workload to best meet the CA 7 scheduling criteria. In times of stress, critical applications are escalated without the need for manual job-by-job management and your production batch is completed in the best time possible. CA 7 Workload Automation and **ThruPut Manager AE with PCS** working together provide a complete batch solution for z/OS Production Control," said Jose Danobeitia, President and Chief Technology Architect of MVS Solutions Inc.

**ThruPut Manager AE with PCS** is an all-encompassing strategic solution to manage z/OS production batch and demonstrates MVS Solutions' continuing commitment to batch automation solutions for z/OS.

**About MVS Solutions Inc.**

MVS Solutions Inc., founded in 1987 and headquartered in Toronto, Canada, provides software solutions for batch service automation in a z/OS JES2 and Workload Manager environment. The company is privately held and the principals have been actively involved in its operation from its inception. Additional information is available at [www.mvssol.com](http://www.mvssol.com).
