

Open your Batch Window

**ThruPut
Manager[®] 6**
Standard
E D I T I O N

*with Automated Job Setup
and Virtual Volume Staging*

Advanced setup of virtual and robotic tape volumes and archived datasets reduces batch job elapsed time and gives significant batch window relief.

Performance Highlights:

- At job submission time, ThruPut Manager
 - determines all required volumes and datasets
 - recalls non-cached virtual volumes and archived datasets
 - initiates robotic and manual volume retrieval
 - eliminates unnecessary DFSMSHsm recalls.
- Applies to all batch, not just scheduled jobs.
- ThruPut Manager's analysis means the volume and dataset information is timely, accurate and complete.
- A totally automated facility independent of any pre-processed reports.
- Transparent to users and their JCL.
- Supports IBM, StorageTek, CA-VTape and DFSMSHsm.

With ThruPut Manager, setup activity takes place during JES2 queue time. By ensuring that external resources are available prior to execution, batch runtime is reduced. Your critical path jobs are streamlined and your batch window capacity is increased.
